                                                                                     W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are active substances used for decarboxylase (GAD). The fragments are multitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of the order that the site of administration and the control of the control 
                                                                                                                                                                                                                                                                                                                                                                      Skin test involving

Pharmaceutical compsns. conty. these peptides and those shown in R88668-72, are useful for the diagnosis of a disease or predispositions of immune system disease, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,

diagnosis and treatment of auto:immune disease, esp. insuli
dependent diabetes, also related nucleic acid, vectors,
antibodies, hybridoma(s) etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acid decarboxylase (GAD65) respectively, from which the GAD65 fragments described in R72261-R72298 were derived. These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.

                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a fragment of the glutamic acid decarboxylase 60 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are available from natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GAD65; glutamic acid decarboxylase 65; autoimmune disorder; IDDM; insulin dependent diabetes mellitus; Stiff man disease; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q86481 and Q86482 encode R71733 and R79105, rat and human glutamic acid decarboxylase (GAD65) respectively, from which the GAD65 fragments described in R72261-R72298 were derived. These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide fragments of glutamic acid decarboxylase - for diagnosis and treatment of auto:immune disease, esp. insulin dependent diabetes, also related nucleic acid, vectors, antibodies, hybridoma(s) etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GAD65; glutamic acid decarboxylase 65; autoimmune disorder; insulin dependent diabetes mellitus; Stiff man disease; diac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

      R88668 is derived from residues 306-325 of human glutamic acid decarboxylase and specifically reacts with a T-cell sub-population isolated from recently diagnosed Type-I diabetics, Pharmaceutical compsns. contg. this peptide and those shown in R8867 and R76642-62, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn., e.g. by reinjection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are
                                                                                                                                                                       Antigen-specific activated T-lymphocytes and their detection interaction with inventive peptide(s) of peptide-MHC complex useful in diagnosis of e.g. diabetes and auto:immune disease
                                                                                                                                                                                                                                                                                                            (ENDL/)

                                                                            W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases, which is effected diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.

These peptides are reactive with the monoclonal antibody (MAb) of the invention, pref. the mouse MAb KM890, belonging to the IgG3 subclass. This MAb may be used in immunohistochemical staining for quantitative determination of DCC gene proucts, as well as for cancer diagnosis, eg. by histological tissue examination and imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Epitope;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R76642-62 are derived from human glutamic acid decarboxylase and specifically react with T-cell sub-populations isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. contg. these peptides and those shown in R7571-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tunours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antigen-specific activated T-lymphocytes and their detection interaction with inventive peptide(s) of peptide-MHC complexes; useful in diagnosis of e.g. diabetes and auto:immune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-FEB-1994;

                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel peptides (Y08119-Y08212) with affinity for coagulation factor VII which can be used for for labeling, identification of factor VIII. Some are specific for one of natural and recombinant factor VIII, others are reactive with both forms. Factor VIII is used to treat disorders of blood coagulation. Using relatively small peptides, rather than large antibody molecules generally used, simplifies purification of factor VIII. The peptides are of formula R1-X-R2 where R1 = amino or a peptide; R2 = carboxy or a peptide and X = a peptide of at least 3, preferably 7-12, amino acid residues.

Recombinantly produced NDF bearing this N-terminal sequence was found to stimulate tyrosine phosphorylation of the neu receptor protein in an activity assay. NDF peptides have the ability to induce a differentiated phenotype in certain cell lines and can stimulate or inhibit proliferation of certain cell lines. The NDF's can be used to treat wounds, tumours derived from epithelial tissue of the breast, stomach etc., gastrointestinal disease, Barrett's cesophagus, (non-)cystic kidney disease or inflammatory bowel disease. The CDNA sequences encoding these protein sequences were used in the isolation of related sequences from human CDNA libraries which encode human NDF's.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          differentiation factor (NDF), NDF-betal(177-246). Recombinantly produced NDF bearing this N-terminal sequence was found to stimulate tyrosine phosphorylation of the new receptor protein in an activity assay. NDF peptides have the ability to induce a differentiated phenotype in certain cell lines and can stimulate or inhibit proliferation of certain cell lines. The NDF's can be used to treat wounds, tumours derived from epithelial tissue of the breast, stomach etc., gastrointestinal disease, Barrett's oesophagus, (non-)cystic kidney disease or inflammatory bowel disease. The CDNA sequences encoding these protein sequences were used in the isolation of related sequences from human CDNA libraries which encode human NDF's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant new differentiation factors and correspare used in the treatment of tumours, dermal wounds, and gastrointestinal, kidney and inflammatory bowel diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hu S,

W884045-49 represent the peptide fragments obtained after trypsin digest of the protein gp30. Gp30 is a 30 kDa growth factor that induces phosphorylation of erbB-2 protein p185 in cells that overexpress erbB-2, induces internalisation of the erbB-2 receptor, stimulates growth of erbB-2-overexpressing cells at low concentrations, inhibits growth of erbB-2-overexpressing cells at high concentrations, reverses
                                                                                                                                                                                (/DAD/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptides were purified from media conditioned by the oestroge receptor negative human breast cancer cell line MDA-MB-231 and the Sk-Br-3 breast cancer cell line. The polypeptides were partially digested with trypsin and the tryptic peptides were separated by HPIC on a C18 reversed phase column. Single peaks were subjected protein sequence analysis; five independent fragments were sequenced. The present sequence was obtained from peak 5.

inhibiting the ya

(epidermal growth factor

receptor),

where the

erbB-2 cells are

This sequence represents a fragment of the gp30 protein (I) that binds to clone gp30/alphal. The invention relates to a protein (I) that binds to heparin-Sepharose, has a molecular weight of 30 kDa (22 kDa after N-glycanase digestion), an amino acid sequence of a 22 kDa peptide produced by in vitro translation of poly-A RNA from MDA-MB-231 cells, and produces the same pattern as the translation product of the MDA-MB-231 cells upon hydrolysis with Staphylococcus aureus VB protease or elastase. (I) is useful for stimulating the growth of normal cells an inhibiting the growth of cells which overexpress the oncogene exbB-2 inhibiting the growth of cells which overexpress the oncogene exbB-2

Example 20; Fig 17b; 61pp;

The specification describes an antibody that reacts specifically with the gp30 protein, but does not cross-react TGF-alpha, EGF, amphiregulin or HB-EGF. The antibody can be used to detect the 30 kD erbB-2 ligand (gp30) in serum or urine samples as a prognostic/diagnostic marker for tumour progression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preferably adenocarcinoma cells. Monocional antibodies to the growth factor ligand gp30 are useful as a prognostic or diagnostic marker for tumour progression. The protein can be used to treat cancers associated with the erbB-2 oncogene product overexpression, including breast, ovarian, gastric, lung, prostate, salivary gland and thyroid carcinomas.
                                                                                                     regulating transcription. They are produced by recombinant DNA methods, by peptide synthesis or by enzymatic cleavage of RIZ. RIZ or its active fragments (see also R92107-09) can be obtd. by recombinant DNA methods, and used to identify agents that modulate cell proliferation and thereby treat tumour growth or

                                                                                                                                                                                                                  The wild-type NF is pref. NGF, BDNF, NT-3 or NT-4. In the 30-34 region, the modifications are pref. at Lys32 (or Arg3 in NT) and/or Lys34; in the 93-98 region, Lys95 is partic. replaced by Ala. Esp. for NT-3, Arg32, His34, Asn93 and/or Asn94; for BDNF, Lys95, Lys96 and/or Arg97, and for NT-4 Glu94 and Arg96 are replaced. The mutants differ from wild-type NF as regards receptor binding affinity and specificty, esp. they can bind to trk receptor but not to p75NGFR. Modifications in the 25-36 amino acid region improve stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comparison of NGF genes from different species has revealed clusters of amino acid residues which are highly conserved across different gps of vertebrates (rat mouse, human, bovine, guinea pig and chicken NGF: R41747; xenopus NGF: R41748; snake NGF: R41749; rat BDNF: R41750; rat NT-3: R41751; and xenopus NT-4: R41752).

New mutant neurotrophic factor (NF) comprises a wild-type NF having, as modification, replacement of one or more positively charged amino acids, in the amino acid regions 30-34 or 93-98, with uncharged or negatively charged amino acids, so that the mutants have reduced ability to bind to p75NGFR (a transmembrane glycoprotein which binds NGF with low affinity), c.f. wild-type NF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18-MAR-1994 (first entry)
                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New mutant forms of neurotrophic factor of increased stability have specific positively charged aminoacid(s) replaced, showing more selective binding but equiv. biological activity

                                                                                                                                                                                                                                                                                                        Y30496-513 represent amino acid substitution variants of a major epitopic region 2 of the CD2 protein. The peptides were acquired by mutant selection. The CD2 protein and epitopes are used to demonstrate the method of the invention. The specification describes a rapid mutational analysis method for mapping protein epitopes and binding domains, by identifying substitution mutations that result in the loss of binding capacity. The method may be used for mapping protein epitopes, antigenic domains and binding sites. It has been used for mapping binding sites for sixteen anti-CD2 and anti-CD4 monoclonal antibodies. The method is especially useful for ligand binding site studies for the design of
                                                                                                                                                                                                                                                                    new ligands and drugs.
note: This sequence does not appear in the specification it was created using information provided.

TRIPs competitively bind to and inhibit the thrombin receptor without afecting thrombins activities toward fibrinogen and other proteins involved in coagulation. They can be used for inhibiting thrombin-induced platelet activation and inhibiting thrombin-induced smooth muscle cell proliferation. They can be used for treating and preventing neurodegenerative disease, treating and preventing bone resorption (eg. in osteoporosis), treating and preventing thrombin-induced inflammation, eg. in adulteration damage) and for inhibiting platelet-dependant thrombos. Fusion proteins containing these sequences may also act as thrombin containing these sequences may also act as thrombin-induced inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peptides (TRIPS). TRIPS competitively bind to and inhibit the thrombin receptor without afecting thrombins activities toward fibrinogen and other proteins involved in coagulation. They can be used for inhibiting thrombin-induced platelet activation and inhibiting thrombin-induced smooth muscle cell proliferation. The can be used for treating and preventing neurodegenerative disease, treating and preventing bone resorption (eg. in osteoporosis), treating and preventing thrombin-induced inflammation, eg. in adult treating and preventing thrombin-induced inflammation, eg. in adult

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a fragment of alpha 3-tubulin derived from a consented. This sequence was used as a part of an aligned peptide array of the invention. The aligned peptide array comprises, as separate elements, peptide segments obtained by dividing the amino acid sequence of a protein into sequence segments of any suitable length and of any suitable frame and synthesizing peptides on the basis of the sequence segments, preferably with the amino acid sequences of the peptide segments. CC expressing the amino acid sequence of the protein. The peptide array can be used in a method for the detection of a binding or interaction site of a protein; in a method for the detection of a binding or interaction site of a protein; in a method for the modification of a protein; and in a method for the detection of a bigand for a protein; in a cc method for the modification of a protein; and in a method for the design of a protein. Using the information from the above methods, ligands concerned by them can be modified, or designed. The peptide array can also be used in a viroimmunoassay method, represented by ELISA. The array can be used in a viroimmunoassay method, a metalloimmunoassay method, a fluoroimmunoassay method, a metalloimmunoassay method, a rediction metalloimmunoassay method, a rediction metalloimmunoassay method.

                                                                                                                                                                                                                                                                        The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.

Peptides using the D-form amino acids are more effective immunomodulators than their diastereomers or enantiomers.
                                                                                                                                                                                                                                            Sequence

Pharmaceutical compsns. contg. these diagnosed Type-I diabetics. Pharmaceutical compsns. contg. these specifically reactive useful for the diagnosis of peptides and those shown in R88668-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect according to the peptides are able to according to the peptides are able to detect according to the peptides are able to detect according to the peptides are able to according to the peptides are according to the peptides a
                                                                W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosts of insulin-dependent diabetes mellitus (IDDM). The diagnosts is determined by using a claimed method for diagnosts of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R76642-62 are derived from human glutamic acid decarboxylase and specifically react with T-cell sub-populations isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsus. contg. these peptides and those shown in R86668-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Fig
W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administrating an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                Claim 11; Fig 1; 12pp;

These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                  Score

synaptosomal-associated protein SNAP-25 peptide 8 - rabbit (fragment)
N;Alternate names: superprotein peptide 8
C;Species: Oryotolagus cuniculus (domestic rabbit)
C;Date: 31-Mar-1993 #sequence_revision 18-Nov-1994 #text_change 15-Jun-1996
C;Accession: C44023
R;Loewy, A.; Liu, W.S.; Baitinger, C.; Willard, M.B.
J. Neurosci. 11, 3412-3421, 1991
A;Title: The major 355-methiooine-labeled rapidly transported protein (superprotein)
A;Reference number: A44823; MUID:92044785
A;Accession: C44023
                                                                                                                                                          A;Molecule type: protein
A;Residues: 1-14 <LOE>
A;Experimental source: visual tissue
A;Note: sequence extracted from NCBI backbone (NCBIP:64253)
C;Keywords: membrane trafficking
